Using Git and GitHub

Tecnología de Videojuegos

Objectives

- 1. Understand the need of SCM
- 2. Implement software development workflows with Git and Github

Bibliography

1. GitHub Guides. (Link)

Table of Contents

- I. Version control
- 2. Git
 - What is Git?
 - Git sites
 - Git vs. SVN
- 3. Using Git
 - Conflicts
 - Commits
 - Branches
 - Tags
 - Good practices
- 4. GitHub
 - Features
 - README
 - Markdown

Version control

Version control systems

Version control systems (VCS) keep track of changes to source code. Allows multiple people to edit a project in a predictable manner.

Main open source VCS

- 1982 RCS
- 1990 CVS
- 2000 Subversion
- 2005 Git/Mercurial

There are many proprietary ones but Git is now the most popular one by far. All software should be under a version control system, if not, it ain't software!

What is Git?

Git is an open source distributed version control system, created by Linus Torvald.

Git sites

It is easier to start with free hosting sites instead of maintaining your own server.

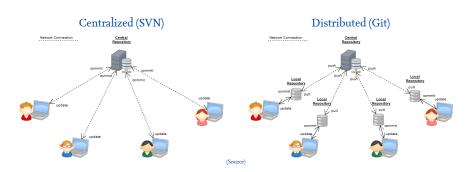

- GitHub: public repositories (as many as you want), but private ones are not free (except for academia). It is now part of Microsoft
- Bitbucket: allow us to keep private repositories limiting the number of collaborators.
- GitLab: both public and private without limitations. It is becoming more popular.
- Others ...

It is typically used as central repository:

- from which everyone pulls other people's changes
- to which everyone pushes changes they have made

Git vs. SVN (I)

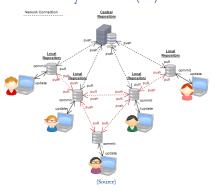

Disclaimer: Do not pay attention to the labels of these diagrams

Git vs. SVN (II)

Fully distributed (Git)

Key Git concepts to know

- repository (local or not)
- clone
- commit, push
- pull, fetch
- remote, origin
- merge

If two people both modify the same file, the first to push wins. The second person will have to pull and merge before pushing.

- Changes in different parts of a file are automatically merged
- Changes in the same part of a file cause conflicts
 - Select either your changes or remote, or a mix of the two

Commits

• Every commit has an ID (its hash)

Branches

Branches are used extensively (e.g. some like feature branches).

- A repository (local and remote) can have explicit branches
- The default branch is called master
- A merge is a fusion between two branches

Do no use branches in the project!

Tags

A tag is a pointer to a specific point in the repository history

- Tags usually have names (e.g. "v1.1")
- Widely used to keep and publish software releases

You might try to tag your project

Good practices

Learn on the job: the best way to learn it is by using it.

Best practices

- Regularly push and pull (at least daily, in general)
- Don't push half-baked changes
- Don't pull if you're in the middle of a task
- Never commit temporal/intermediate files
- The master must be a clean and functional version of the project

Features

Free Git hosting provider

• Free public repositories

User interface to Git

Repository browser

Added value Git operations

- Social network
- Collaborative tools
- Pull requests
- Issue tracking
- Web hosting
- Markdown integration
- Organizations

Key concepts

Key GitHub concepts to know

- Pull request
- Fork

GitHub README

Special file: README.md

- Contains information about the project
- Automatically visualized
- md means Markdown

Markdown: Trivial markup

- Simple
- Very simple
- Extremely simple
- Did I say it's simple?

VERY powerful

- Several outputs
- Professional quality
- ... and simple!

Markdown (II)

Markdown example

```
#Iama header
## I am a subheader
Regular, *italic* and **bold**
  List item T

    List item 2

[I am a link](http://foo.com)
![I am a pic](markdown.png)
~~~ C
printf("Hello, world");
```

I am a header

Lam a subheader

Regular, italic and bold

- List item 1
- List item 2

I am a link

I am a pic

printf("Hello, world");
